FOMO? Investors Fear Missing Out as Companies Stay Private for Longer

May 24, 2019

Stephen H. Dover, CFA
Executive Vice President,
Head of Equities

Many companies are staying private for longer before deciding to go public—if they do so at all. But what does that mean for investors? Our Head of Equities, Stephen Dover, says the type of gains many stocks have seen right after their public-market launches could be a thing of the past. He also makes the case that this private-for-longer trend favors active managers who can invest in these companies at a potentially faster stage of growth.

I'm often asked by investors about the advantages that an actively managed mutual fund offers over a passive fund. In light of the recent high-profile initial public offerings of Uber, Lyft and Pinterest, I would call attention to the fact that many actively managed mutual funds have access to companies that aren't yet listed on a stock exchange.

Many companies today are staying private for longer periods of time before deciding to go public—if they do so at all—and this “private-for-longer” trend has some significant implications for investors and the market.

All US companies start out as privately held—many as small family businesses. As a company starts to grow, often outside capital is needed to continue to expand and fuel the business. Staying private can make raising that capital (that is, finding outside investors) more difficult. However, that challenge isn't as big as it used to be.

Today, many companies no longer feel the need to list on a public market like the New York Stock Exchange, NASDAQ or other global stock exchange to raise money via an initial public offering (IPO). “New economy” companies in particular are more easily able to obtain funding without going public. So, these companies are often staying private for longer.

Going public can allow a company to quickly raise lots of capital from a large number of shareholders. It also means a company has to answer to those shareholders and follow greater regulatory requirements, and it can cost a lot of money to list.

Many large companies today with valuations over \$1 billion (known as “unicorns”) are still private and do not have current plans to list. As of 2018, the median age of venture-capital-backed technology companies at time of IPO rose to 10.9 years, up from 7.9 years in 2006.¹

These more mature-company IPOs can affect the dynamics of the public markets.

Number and Median Age of IPOs in the United States

Since many companies hitting the public market today have been in operation quite a while prior to deciding to go public, it has often been the case that more of the appreciation in their value is happening prior to the launch of their IPO. In the past, it was certainly not unusual for companies to see big upswings in the price of their shares right after going public—particularly technology companies. (Remember the dot.com boom days of the 1990s?)

Many companies that have been going public more recently aren't experiencing that same type of post-IPO appreciation—again technology or "new economy" companies in particular. So, we could see a new kind of boom-and-bust cycle that could be a risk for investors. We've dubbed the prolonged bullish cycle we've been in as a bit of an "unloved" bull market, and this dynamic of post-IPO letdown could be a reflection of that sentiment.

Why Go Public?

As mentioned, most companies go public to raise large amounts of capital. Certainly, there are still plenty of IPOs hitting the market—Lyft, Pinterest and Uber being recent examples. Other new-economy companies expected to go public this year include data-mining company Palantir Technologies, messaging platform Slack and home-rental company Airbnb.²

An additional reason to go public relates to employee incentive programs. Many new companies offer their employees a stake in the business as a benefit of working there. Going public would typically help their employees cash out their shares more easily. However, today there are online platforms like Forge Global, SharesPost and EquityZen that allow employees and other private shareholders to sell unlisted company shares, so it's not as necessary to be listed publicly for this reason.

Many companies are raising capital more easily without the need to go public. Even if unlisted companies are unprofitable, there are often private investors willing to invest in them, because these companies may have new business models that are disrupting established industries. Of course, investors expect them to eventually be profitable.

Who are these private-company investors? They include the aforementioned venture capitalists as well as independent investors, but also may include mutual funds. With the latter, mainstream retail mutual fund investors are able to access these private opportunities and potentially benefit from valuation growth while they are still private. I'll dive more into that a bit later, but in our view, this feature alone can make a strong case for considering actively managed strategies, versus investing in a passive index-based vehicle.

Over the past decade, a large amount of capital has been funneled into startups, making securing funding relatively easy and allowing private companies to think big and grow fast. In 2018, venture capitalists and other non-traditional investors invested \$131 billion into private companies.³

As a result of this flood of capital, we've also seen an increase in unicorns. There are 145 unicorns in the US alone, worth an aggregate valuation of \$556 billion.⁴

Can the Market Absorb these Outsized IPOs?

There are expectations that many unicorns, and even a few “decacorns” (companies with a value greater than \$10 billion), will in fact go public in 2019. The total amount raised could reach \$80 billion in 2019, double the yearly average since 1999.⁵ Meanwhile, US equity markets had \$38 billion in outflows during the first quarter of 2019,⁶ so there is a possibility that these large IPOs may funnel too much equity supply into the market, weighing on the post-IPO performance of these stocks.

That said, considering IPOs have not been more than 1.5% of the market value of the S&P 500 Index in the past 15 years, they may not create a supply issue as long as their IPO timing isn’t too close together.⁷

This also begs the question: Is investing in IPOs a lucrative strategy? Maybe—or maybe not. Returns from US IPOs have been trending lower; US stocks that had an IPO in the first quarter of 2018 returned an average of 15% over the following one-year post-IPO period, less than half of the average of 34% and 39% returns in 2017 and 2016, respectively.⁸

The Active Access Advantage?

Many mutual funds have invested in private companies over the years and stand to potentially benefit as these private companies raise new rounds of funding at higher valuations. Mutual funds tend to have better access to information on these private companies, as they buy into capital raising rounds (which grants them access to company financials and management teams) instead of buying from the employees of these companies.

Mutual fund companies also have robust valuation processes that value these unlisted investments using formulas that incorporate recent funding round valuations, peer valuations, and trends and outlooks for these companies. This helps ensure that investors in mutual funds get an accurately valued portfolio, even for the unlisted holdings.

Pre-IPO companies like to have long-term investors, so they often offer shares to mutual fund companies, which tend to take long-term positions. This practice offers mutual fund investors the potential for early, pre-IPO access to growth companies, and allows the pre-IPO company to have a more stable investor base.

All things considered, we think gaining access to pre-IPO companies is an increasingly compelling argument for investing via actively managed strategies.

What Are the Risks?

All investments involve risks, including possible loss of principal. Stock prices fluctuate, sometimes rapidly and dramatically, due to factors affecting individual companies, particular industries or sectors, or general market conditions. Special risks are associated with foreign investing, including currency fluctuations, economic instability and political developments. Investments in emerging markets involve heightened risks related to the same factors, in addition to those associated with these markets' smaller size and lesser liquidity. Investments in fast-growing industries like the technology sector (which historically has been volatile) could result in increased price fluctuation, especially over the short term, due to the rapid pace of product change and development and changes in government regulation of companies emphasizing scientific or technological advancement or regulatory approval for new drugs and medical instruments.

Actively managed strategies could experience losses if the investment manager's judgment about markets, interest rates or the attractiveness, relative values, liquidity or potential appreciation of particular investments made for a portfolio, proves to be incorrect. There can be no guarantee that an investment manager's investment techniques or decisions will produce the desired results.
